

Visualising a distributed network

Using Worldmap Panel to pinpoint your nodes

Tom Burton · [Follow](#)

36

When building a large distributed network for a blockchain, it's sometimes nice to see how your nodes are distributed around the world. Grafana has a plugin called [Worldmap Panel](#). It allows you to provide a list of locations and watch them light up a map for your viewing pleasure.

<https://grafana.com/grafana/plugins/grafana-worldmap-panel/>

I'd like to share with you today how I generated a similar view using just the IP addresses of the nodes.

Node Exporter, Prometheus, Grafana

Setting up and configuration of the above is outside the scope of this tutorial. We use the inbuilt Prometheus service discovery modules to automatically add nodes from the various cloud providers around the world.

Worldmap Plugin

Depending on your Grafana setup, it may be as simple as

```
grafana-cli plugins install grafana-worldmap-panel
```

JSON API Plugin

This plugin allows us to run JSON queries and store them as a table.

```
grafana-cli plugins install marcusolsson-json-datasource
```

IP-API

This free API allows us to provide a list of IP addresses and get an array of latitude and longitudes in return. We can send 45 queries per minute for free, but I will show you how to make sure you don't hit that limit.

You can see the result here:

<http://ip-api.com/json/1.1.1.1>

Configuring the data source

Let's glue these pieces together.

Head to the settings tab on Grafana and add a new data source. We want the JSON API data source. Fill out the details like so:

Data Sources / JSON API

Type: JSON API

⚙ Settings

Name

JSON API

Default

HTTP

URL

http://ip-api.com/batch

Whitelisted Cookies

New tag (enter key to add)

Timeout

Auth

Basic auth

With Credentials

TLS Client Auth

With CA Cert

Skip TLS Verify

Forward OAuth Identity

Custom HTTP Headers

+ Add header

Misc

Query string

page=1&limit=100

Back

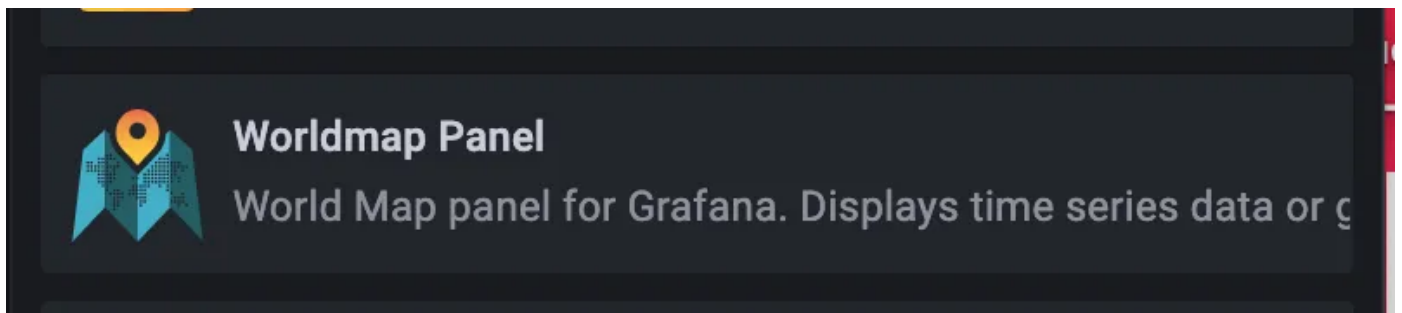

Delete

Save & test

Note: you will get an error at this point. This is okay. We haven't sent data in the correct form yet.

Configuring the Dashboard

Head to the Create tab and start a new Dashboard. Add a new panel and add the Worldmap Panel.

We will need a list of IP addresses. The easiest metric to obtain this list is up as it includes the `instance` label. Head to your dashboard settings, scroll to variables and create a new one called `ip`. Use the `label_values` function to scrape the list of instance IPs. Use the REGEX below to drop the `:port` from the end of each IP.

```
/(\d{1,3}.\d{1,3}.\d{1,3}.\d{1,3})/
```

Include All option

Custom all value

blank = auto

Configuring the Panel

We can now start displaying this list. The Worldmap Plugin expects an array of IPs in the following format:

```
[
  {
    "key": "SE",
    "latitude": 60.128161,
    "longitude": 18.643501,
    "name": "Sweden"
  },
  {
    "key": "US",
    "latitude": 37.09024,
    "longitude": -95.712891,
    "name": "United States"
  }
]
```

However, the data we receive looks like this:

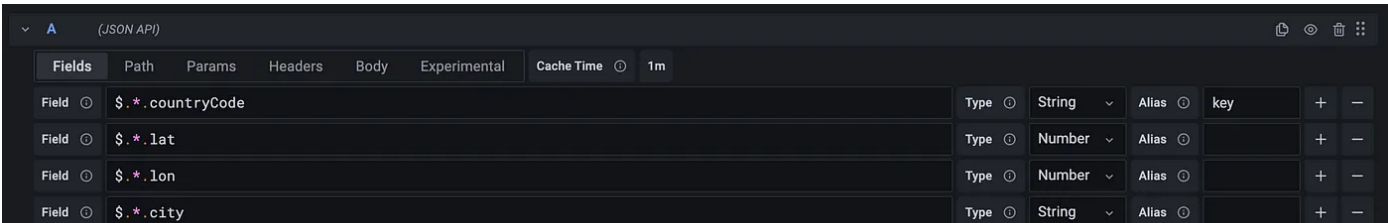

```
[
  {
    "status": "success",
    "country": "Australia",
    "countryCode": "AU",
    "region": "QLD",
    "regionName": "Queensland",
    "city": "South Brisbane",
    "zip": "4101",
    "lat": -27.4766,
    "lon": 153.0166,
    "timezone": "Australia/Brisbane",
    "isp": "Cloudflare, Inc",
    "org": "APNIC and Cloudflare DNS Resolver project",
    "as": "AS13335 Cloudflare, Inc.",
    "query": "1.1.1.1"
  }
]
```

The panel allows us to map the required fields based on the incoming data.

On your newly created dashboard, edit the Worldmap Panel. Add a new data source of the JSON API. Fill out each tab as follows:

⚠️: Make sure to set the Cache Time to 1m otherwise you will get rate limited by IP-API.

Fields

The screenshot shows the configuration interface for a Worldmap Panel. The 'Fields' tab is selected, displaying a table with four rows of field mappings. Each row includes a 'Field' column with a dropdown icon, a 'Path' column with a JSON path, a 'Type' column with a dropdown icon, a 'String' column with a dropdown icon, an 'Alias' column with a dropdown icon, and a 'key' column. The 'Cache Time' is set to '1m'.

Fields	Path	Params	Headers	Body	Experimental	Cache Time	1m
Field	<code>\$.*.countryCode</code>	Type	String	Alias	key	+	-
Field	<code>\$.*.lat</code>	Type	Number	Alias		+	-
Field	<code>\$.*.lon</code>	Type	Number	Alias		+	-
Field	<code>\$.*.city</code>	Type	String	Alias		+	-

Notice the Alias for countryCode .

Path

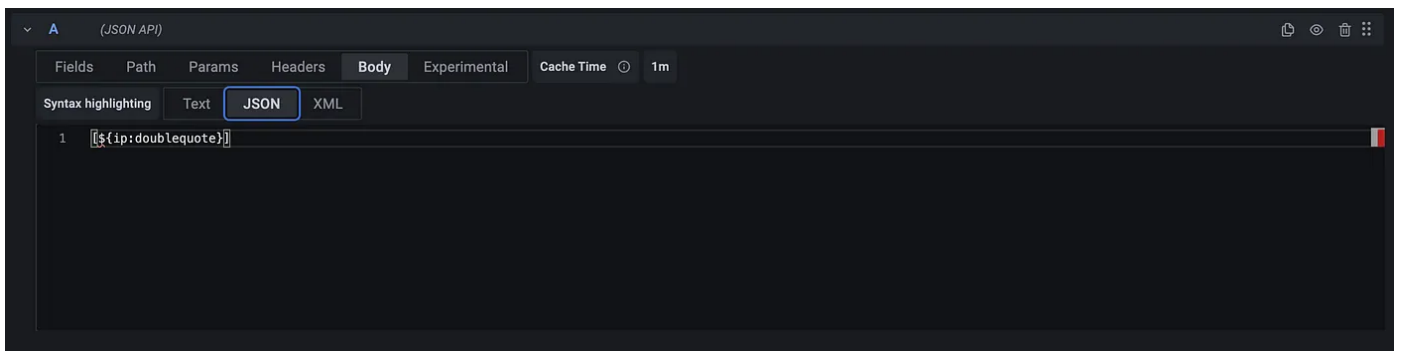

Make sure to set the request to `POST` .

Headers

`Content-Type=application/json`

Body

```
[${ip:doublequote}]
```

What we're doing here is transforming our list of IPs into a comma separated, double-quoted array. The variable we set earlier returns the list of IPs like so:

```
"123.32.424.24, 52.34.63.63"
```

After using the Grafana variable format manipulations, we get:

```
"123.32.424.24", "52.34.63.63"
```

We need to make some edits to the Panel itself. Fill out the following options:

Worldmap

Map Visual Options

Center

Europe ▼

Initial Zoom

3

Min Circle Size

4

Max Circle Size

4

Sticky Labels

Decimals

3

Unit

singular form

plural

Show Legend

Mouse Wheel Zoom

Map Data Options

Location Data

table ▼

Aggregation

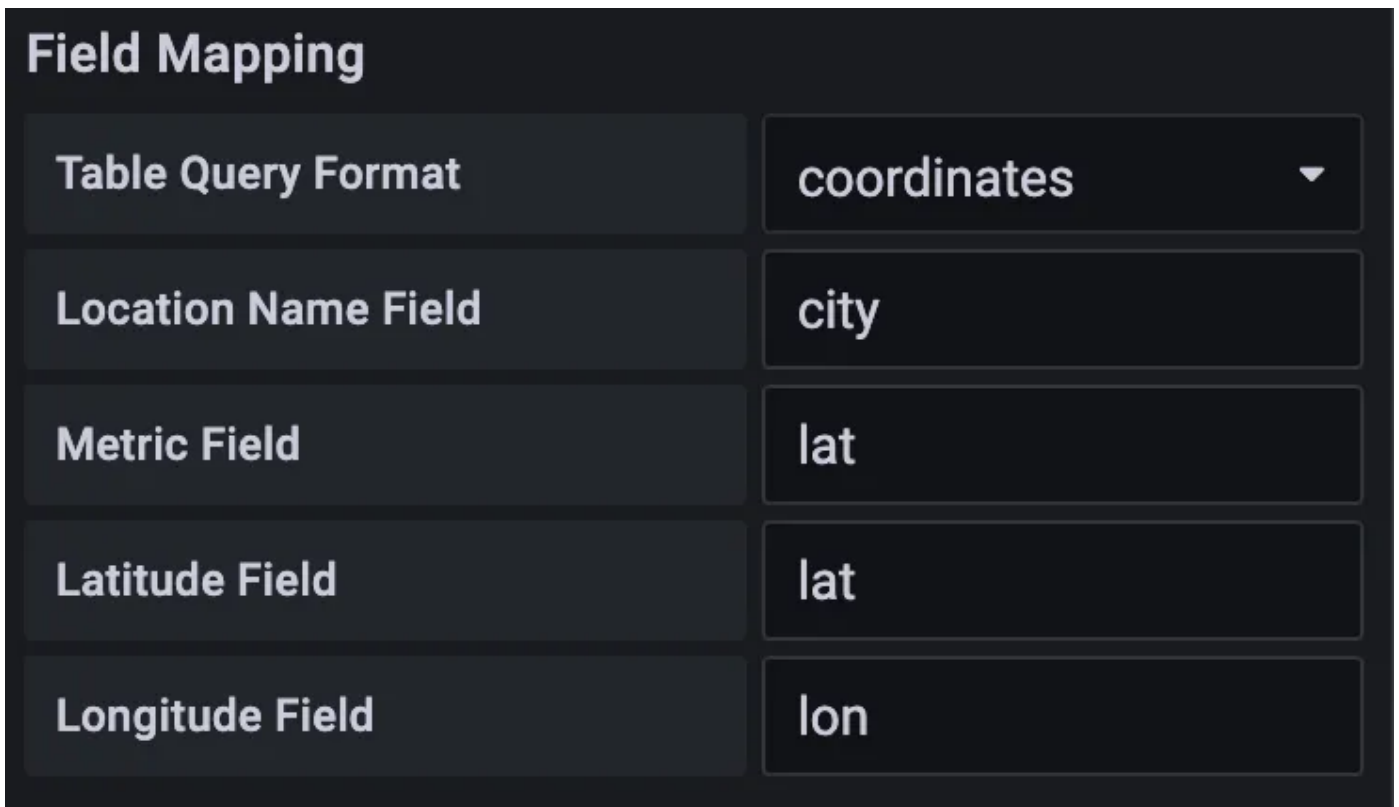

current ▼

You can of course tweak these as you go, but the most important setting is

`Location Data` as this tells the panel what format to expect the data in.

As the IP-API doesn't return any metric that you can use to define the size of the circle, I put the `Max Circle Size` and `Min Circle Size` to equal the same.

Finally, configure the `Field Mapping` section like so:

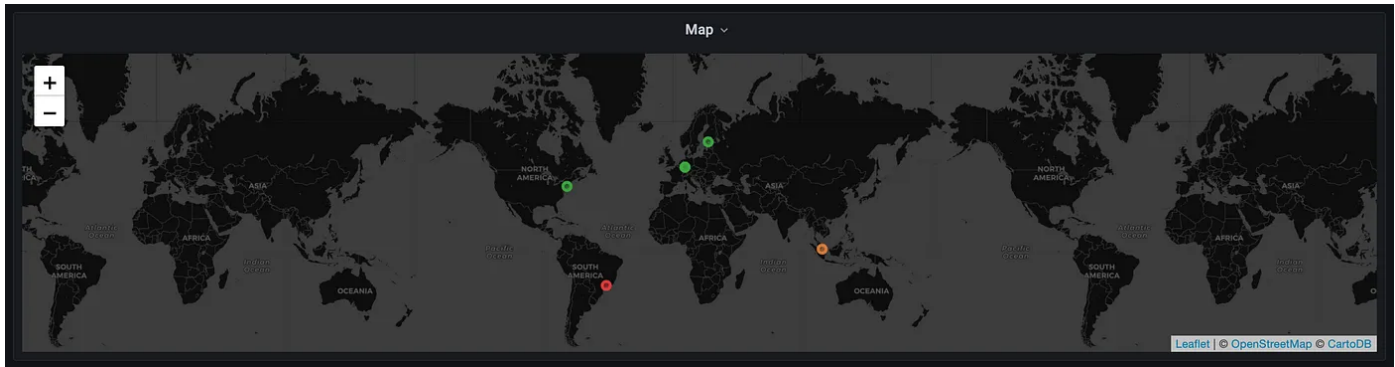

Field Mapping	
Table Query Format	coordinates ▼
Location Name Field	city
Metric Field	lat
Latitude Field	lat
Longitude Field	lon

The `Metric Field` can be left blank if you wish.

Switch over to `Table View` to verify the data is coming in. If you still can't see the data, head over to your browser's `Inspect` window and check the `Network` tab. You should see a failing request. Most likely the data you're sending is malformed, or you have somehow hit the rate limit. Run through the instructions again.

If you've done everything correctly, you should end up with a lovely map like so:

Thanks for reading!
